Ordinary PDK DRC. Both levels ship today, and neither changes when the part becomes part of an assembly.

LEVEL 1

Per-die DRC

shipped by each die PDK

Is each die drawn legally on its own process?

Die PDK rule deck
width, spacing, enclosure, density

→

Geometric rule check

←

Die layout (GDS)
mask artwork on that die's own layers

LEVEL 2

Interposer DRC

shipped by the interposer PDK

Is the interposer drawn legally on its own process?

Interposer PDK rule deck
metal, via, pad and bump rules

→

Geometric rule check

←

Interposer layout (GDS)
routing and attachment artwork

The level the assembly adds. This is the axis the ADK ships.

LEVEL 3

Assembly DRC

shipped by the ADK in this release

Are the dies placed and attached legally on the interposer?

Assembly rule set
ASM placement and IXN interconnect, over abstract inputs an adapter binds

→

Assembly rule deck

←

Assembly layout
assembly GDS, the boundary manifest beside it, and the per-method file when one is used

No PDK deck sees two dies at once, so nothing at level 1 or 2 can check the space between them.
