
interposer GDS top cell, bounding box of all drawn geometry
prBoundary 235/0,
the board outline drawn from Edge.Cuts
position (x, y), the die's anchor point
die
interposer position,
the full GDS bbox centre
(anchor: bbox_center)
position.y
y, increases upward
(y-up cartesian)
(0, 0)
x, increases rightward
micrometres
GDS-bbox-corner,
the canonical origin
position.x
the PCB Edge.Cuts bbox is not this frame; the wire-bond demo carried a hidden shift of (-200, -780) µm between the two
in the normal case the outline contains all drawn geometry and the two rectangles coincide; they are drawn apart here only to name them
the anchor point is the die's bbox centre for anchor: bbox_center (drawn here), and where the die's GDS (0, 0) lands for anchor: gds_origin
