ASM.a chiplet boundaries must not overlap

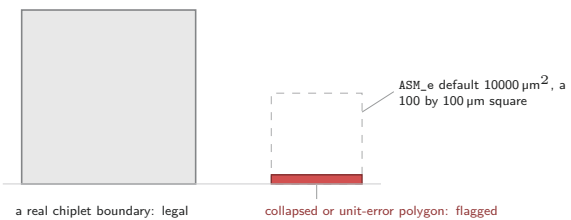

`merged(2)` returns what two or more boundary polygons cover; no per-die identity needed

ASM.b minimum chiplet-to-chiplet spacing

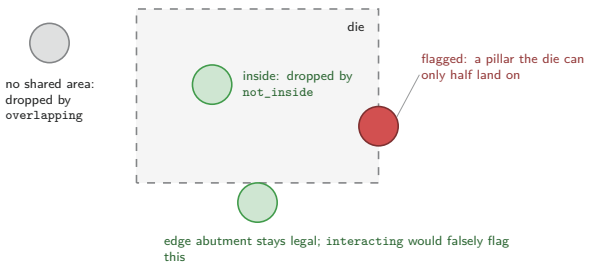

the diagonal gap is as real as the orthogonal one for handling, underfill and assembly tolerance

ASM.e minimum chiplet area

a degenerate-polygon sanity check, not a minimum die size; a boundary of exactly `ASM_e` is not flagged

ASM.f attachment geometry must not straddle a chiplet edge

read the selectors in order: `overlapping` keeps pads sharing area, `not_inside` keeps what is not fully contained
