
1 Design in KiCad
in: die GDS files, an interposer technology, an interconnect technology
1 gds2kicad
die pads to footprints, symbols and pin lists
2 KiCad ADK build
place the chiplets, route the interposer
3 generate_assembly_dru.py
assembly rules checked live while you route
.kicad_pcb
export
2 Export and build
in: the routed .kicad_pcb
4 Chiplet Export plugin
writes the HyperLynx file and an intermediate .chiplet
<board>.hyp
5 hyp_to_gds.py
builds the assembly layout and finalises the .chiplet
interposer.gds + complete.gds
boundary + pillar manifests
finalised .chiplet
consume
3 Check, view and hand off
in: the complete GDS, its manifests and the finalised .chiplet
6 run_drc.py
ADK assembly DRC over the complete GDS
assembly DRC report (.lyrdb)
7 Chiplet Studio
3D and 2D inspection of the assembly
8 chiplet2dbx.py
a 3Dblox model for OpenROAD
3Dblox model
KiCad ADK fork, gds2kicad, ADK rule generator
Chiplet Export plugin and hyp_to_gds.py
three independent consumers of the same artefacts
